

Text Entry

Modelling and Design

Per Ola Kristensson
Department of Engineering
and
Centre for Human-Inspired Artificial Intelligence
University of Cambridge

Plan

- **Session 1**
 - Uncertainty and why we need to design probabilistic text entry methods
- **Session 2**
 - Design engineering as a design method to analytically make sense of AI-infused interactive systems
- **Session 3**
 - Let's do something: statistical keyboard decoding
- **On your own**
 - Interactive iPython notebook allowing you to explore statistical keyboard decoding, including complete code and several interactive exercises

Session 1

Visions of the Future

Visions of the Future

- Ubiquitous sensing
 - Smart home, Internet of Things, etc.
- Pervasive agents
 - Spoken dialogue-based command and query interfaces
- Virtual reality
 - Portable office, training, immersive data analytics
- Phone without a phone
 - Optical see-through head-mounted displays with form factors comparable to everyday glasses

Visions of the Future

- Ubiquitous sensing
 - Smart home, Internet of Things, etc.
- Pervasive agents

All assume fluid interfaces based on
fundamentally **uncertain** interaction

- Portable office, training, immersive data analytics
- Phone without a phone
 - Optical see-through head-mounted displays with form factors comparable to everyday glasses

Computational interaction

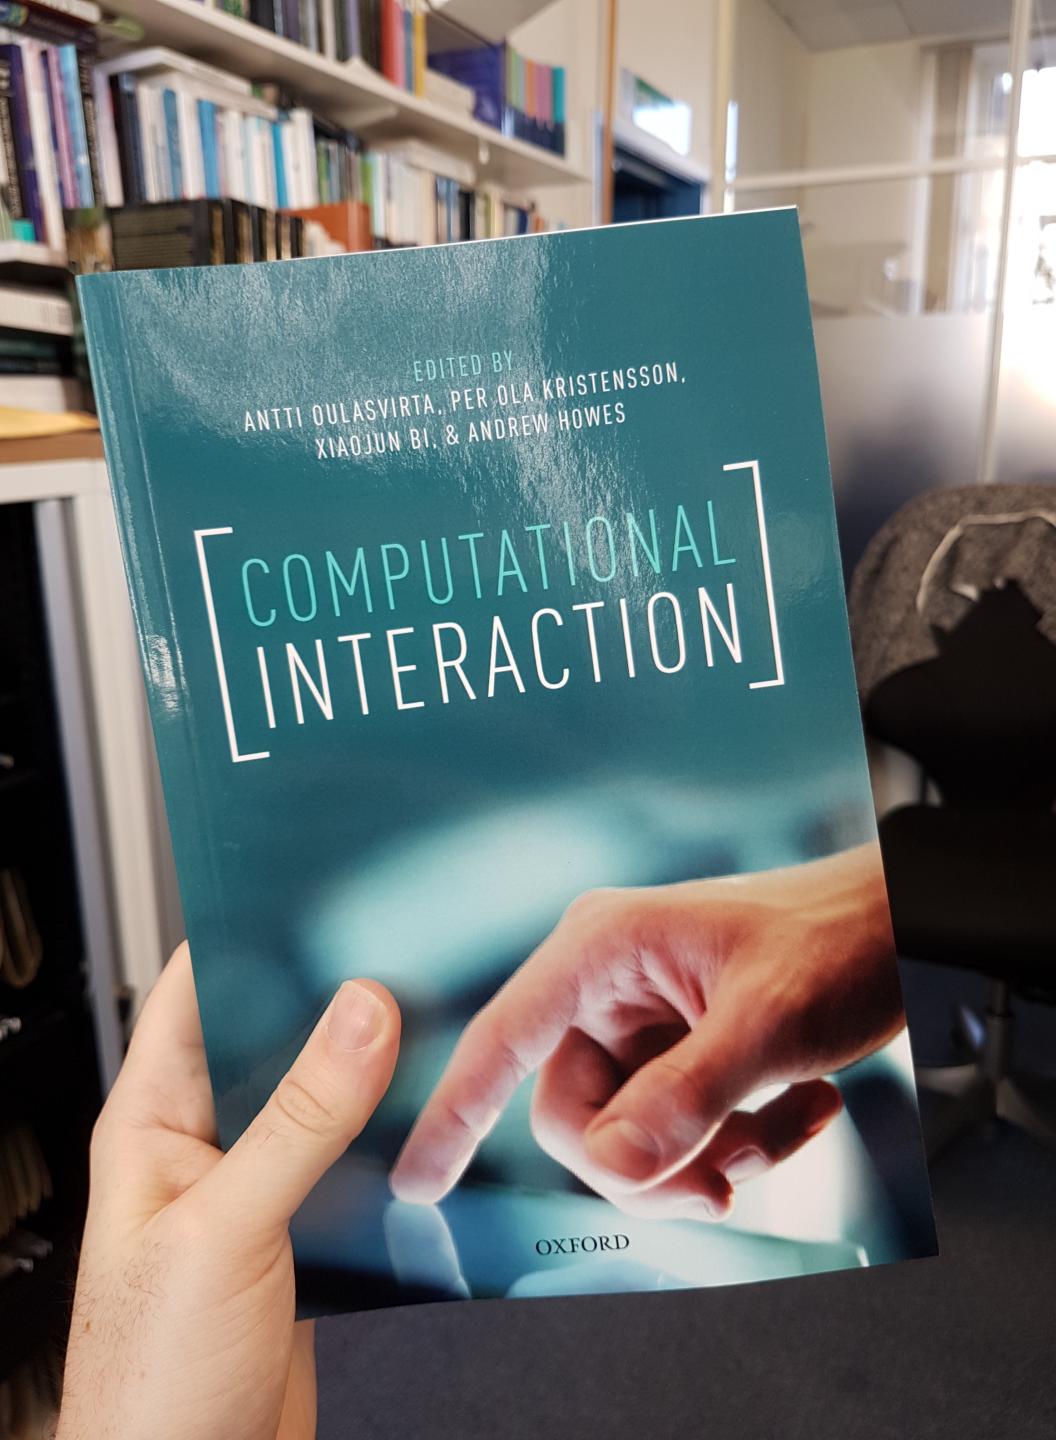

- Classic human-computer interaction (HCI) method does not handle user interface design under uncertainty very well
- Classic HCI method is underpinned on eliciting user needs using a variety of processes and then an iterative process of design and evaluation, in which design is driven by design ingenuity rather than principles
- This means:
 - No automated design work
 - No explicit model
 - Data influenced design only through the designer
- Computational interaction is an emerging discipline in HCI which proposes user interface development by allowing algorithms to perform work, by explicit modelling, and by allowing data to directly influence design.

Computational interaction

- Computational interaction would typically involve at least one of:
 - I. an explicit mathematical model of user-system behavior;
 - II. a way of updating that model with observed data from users;
 - III. an algorithmic element that, using this model, can directly synthesise or adapt the design;
 - IV. a way of automating and instrumenting the modeling and design process;
 - V. the ability to simulate or synthesise elements of the expected user-system behavior.

EDITED BY
ANTTI OULASVIRTA, PER OLA KRISTENSSON,
XIAOJUN BI, & ANDREW HOWES

COMPUTATIONAL [INTERACTION]

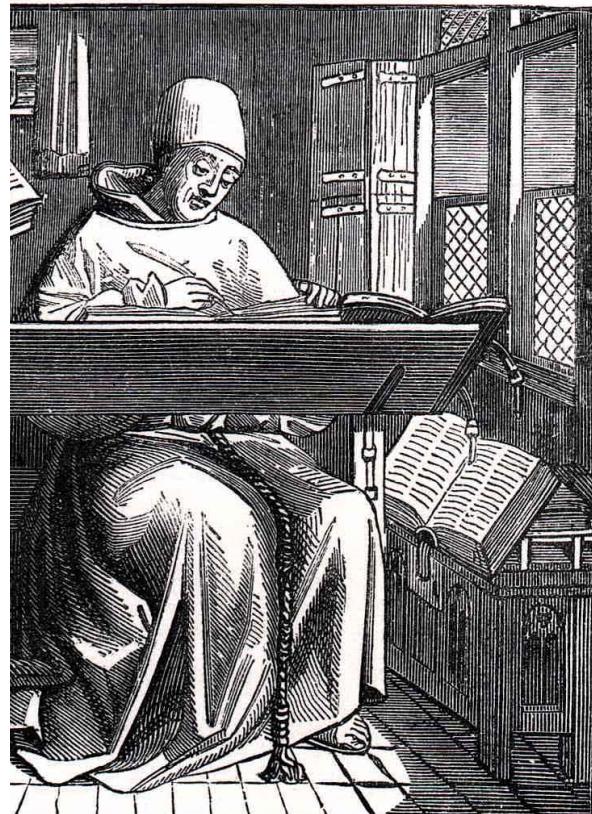

A photograph of a person's hand holding a book. The book has a teal cover with the title 'COMPUTATIONAL [INTERACTION]' in large, white, sans-serif letters. Above the title, it says 'EDITED BY ANTTI OULASVIRTA, PER OLA KRISTENSSON, XIAOJUN BI, & ANDREW HOWES'. At the bottom of the cover, it says 'OXFORD'. The background shows a bookshelf filled with books and a window with a view of a building across the street.

OXFORD

Intelligent text entry as an example
of designing interaction under
uncertainty

Solution principles

- From closed to open-loop
 - Avoid the need for a visual feedback loop
- Continuous novice-to-expert transition
 - Avoid explicit learning
- Path dependency
 - Avoid redesigning the interaction layer
- Flexibility
 - Enable users to compose and edit in a variety of styles without explicit mode switching
- Probabilistic error correction
 - Use the hypothesis space to design optimal error correction strategies
- Fluid regulation of uncertainty
 - Allow users to seamlessly influence the inference process
- Efficiency
 - Let users' creativity be the bottle-neck

SHARK²: A Large Vocabulary Shorthand Writing System for Pen-based Computers

Per-Ola Kristensson ^{§♦}

^{*} Department of Computer and Information Science
Linköpings universitet, 581 83, Linköping, Sweden
perkr@ida.liu.se

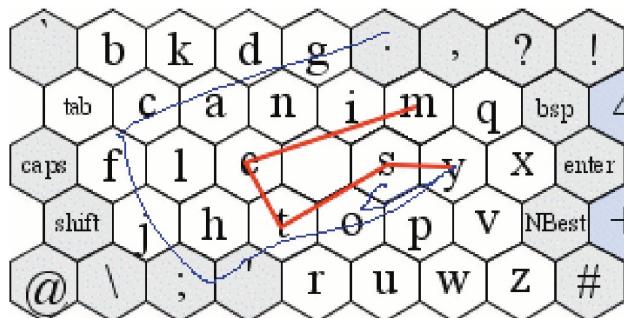

Figure 1. A user has written the word “system” in SHARK² on a 57K lexicon. As is evident in the figure, the system can handle gestures that are far away from the ideal sokgraph (marked in bold), both in terms of overall shape and location proximity. Shown is the ATOMIK layout. Sokgraphs can be defined on any layout, such as QWERTY.

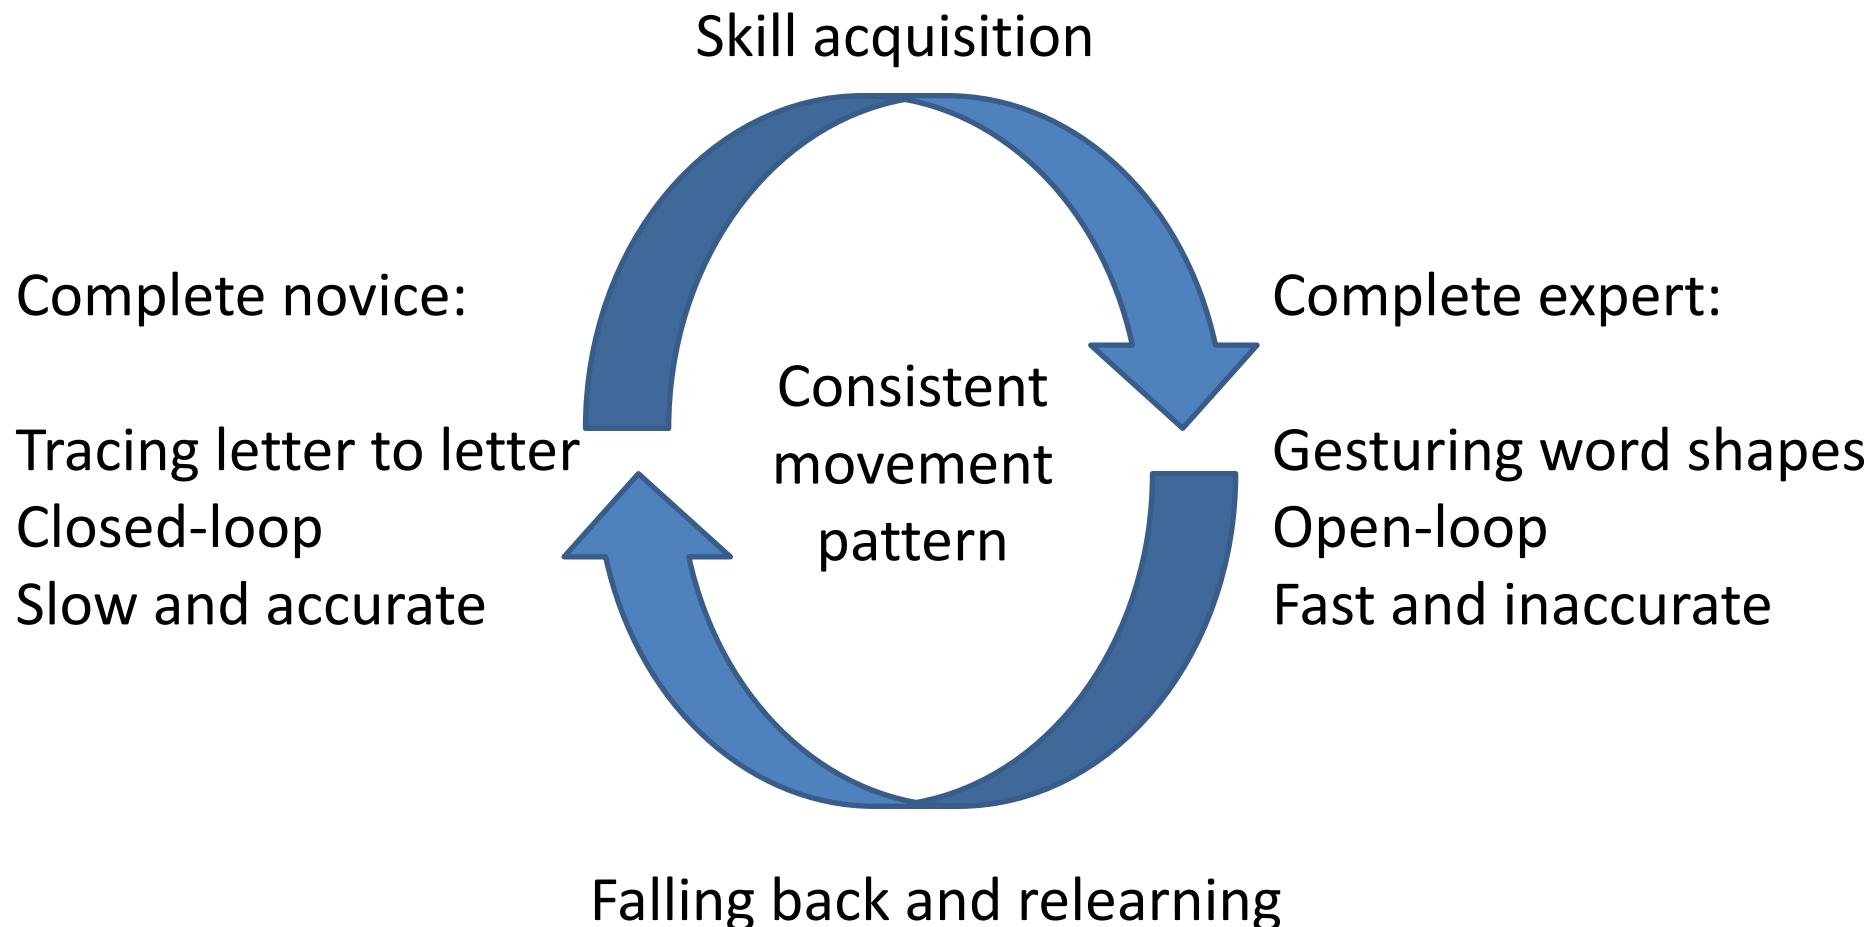

Figure 4. The stream editor showing a fragment of the sentence “Text editing made easy despite recognition errors”. Gray words indicate that the user can press the stylus on them and reveal an N-best list of other possible candidate words.

Closed- and open-loop

- Closed-loop:
 - Continuous feedback-driven interaction
 - Visually-guided motion
 - Slow and precise
 - Modelled well by the “crossing law”
 - Average movement time = $a + b \log_2(D/W+1)$; a and b are linear regression coefficients; D and W are the distance and width to the crossing goal respectively
- Open-loop:
 - Not feedback-driven
 - Direct recall from motor memory
 - Fast and imprecise
 - No good model exists
- Gesture keyboard interaction is a mix of closed- and open-loop interaction

Continuous Novice-to-Expert Transition

Continuous transition from novice to expert behaviour

Kristensson, P.O. and Zhai, S. 2004. SHARK²: a large vocabulary shorthand writing system for pen-based computers. In *Proceedings of the 17th Annual ACM Symposium on User Interface Software and Technology (UIST 2004)*. ACM Press: 43-52.

Path Dependency

Clio and the Economics of QWERTY

By PAUL A. DAVID*

Cicero demands of historians, first, that we tell true stories. I intend fully to perform my duty on this occasion, by giving you a homely piece of narrative economic history in which “one damn thing follows another.” The main point of the story will become plain enough: it is sometimes not possible to uncover the logic (or illogic) of the world around us except by understanding how it got that way. A *path-dependent* sequence of economic changes is one of which important influences upon the eventual outcome can be exerted by temporally remote events, including happenings dominated by chance elements rather than systematic forces. Stochastic processes like that do not converge automatically to a fixed-point distribution of outcomes, and are

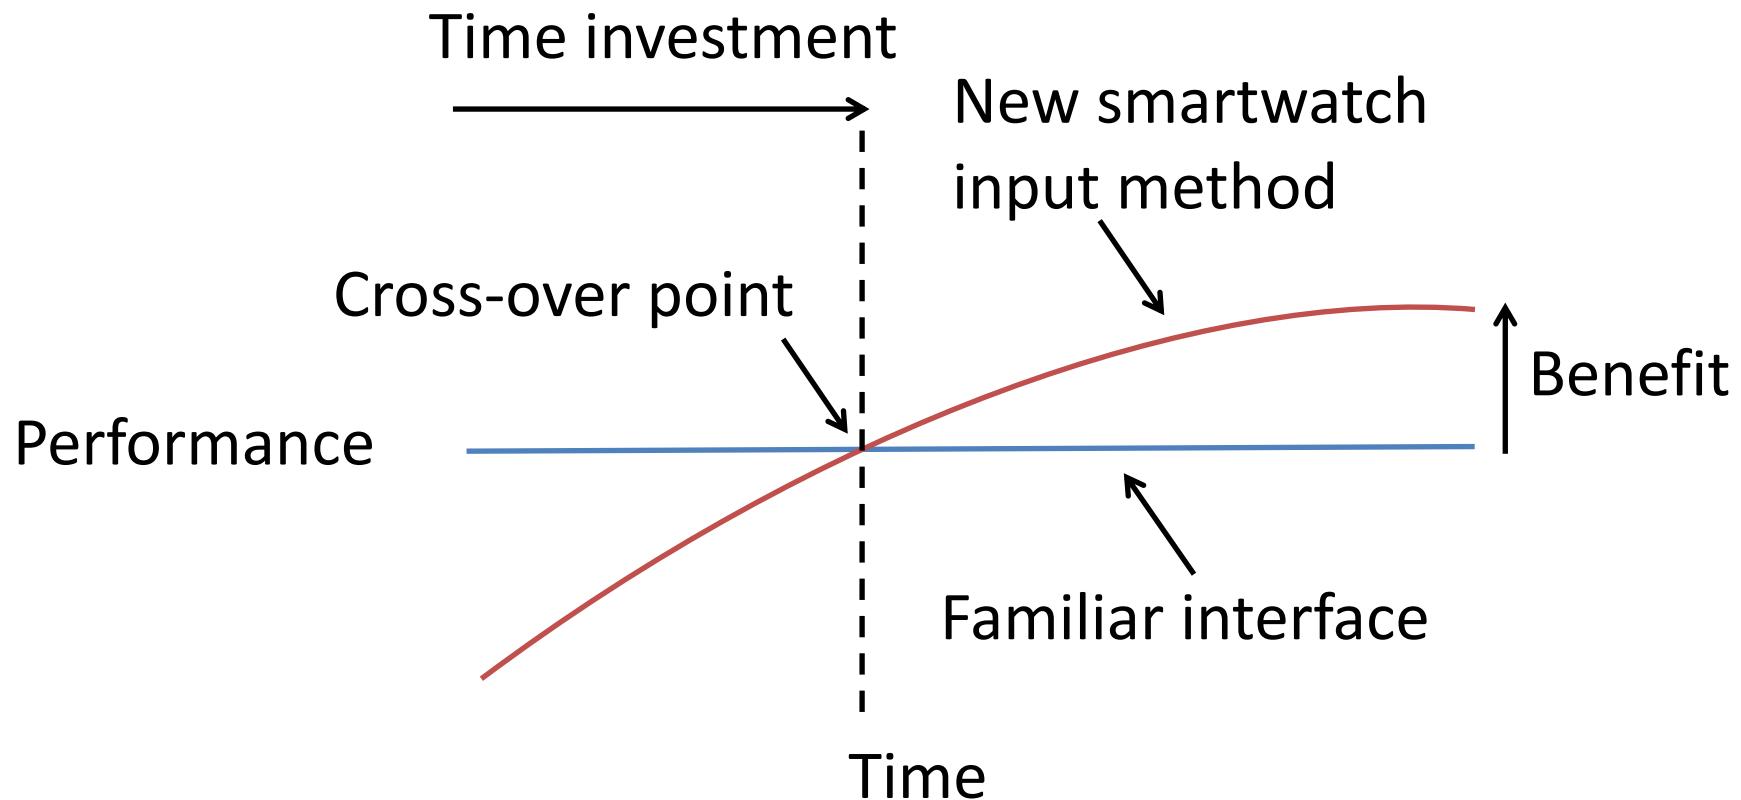

I. The Story of QWERTY

Why does the topmost row of letters on your personal computer keyboard spell out QWERTYUIOP, rather than something else? We know that nothing in the engineering of computer terminals requires the awkward keyboard layout known today as “QWERTY,” and we all are old enough to remember that QWERTY somehow has been handed down to us from the Age of Typewriters. Clearly nobody has been persuaded by the exhortations to discard QWERTY, which apostles of DSK (the Dvorak Simplified Keyboard) were issuing in trade publications such as *Computers and Automation* during the early 1970’s. Why not? Devotees

Example: typing on a smartwatch

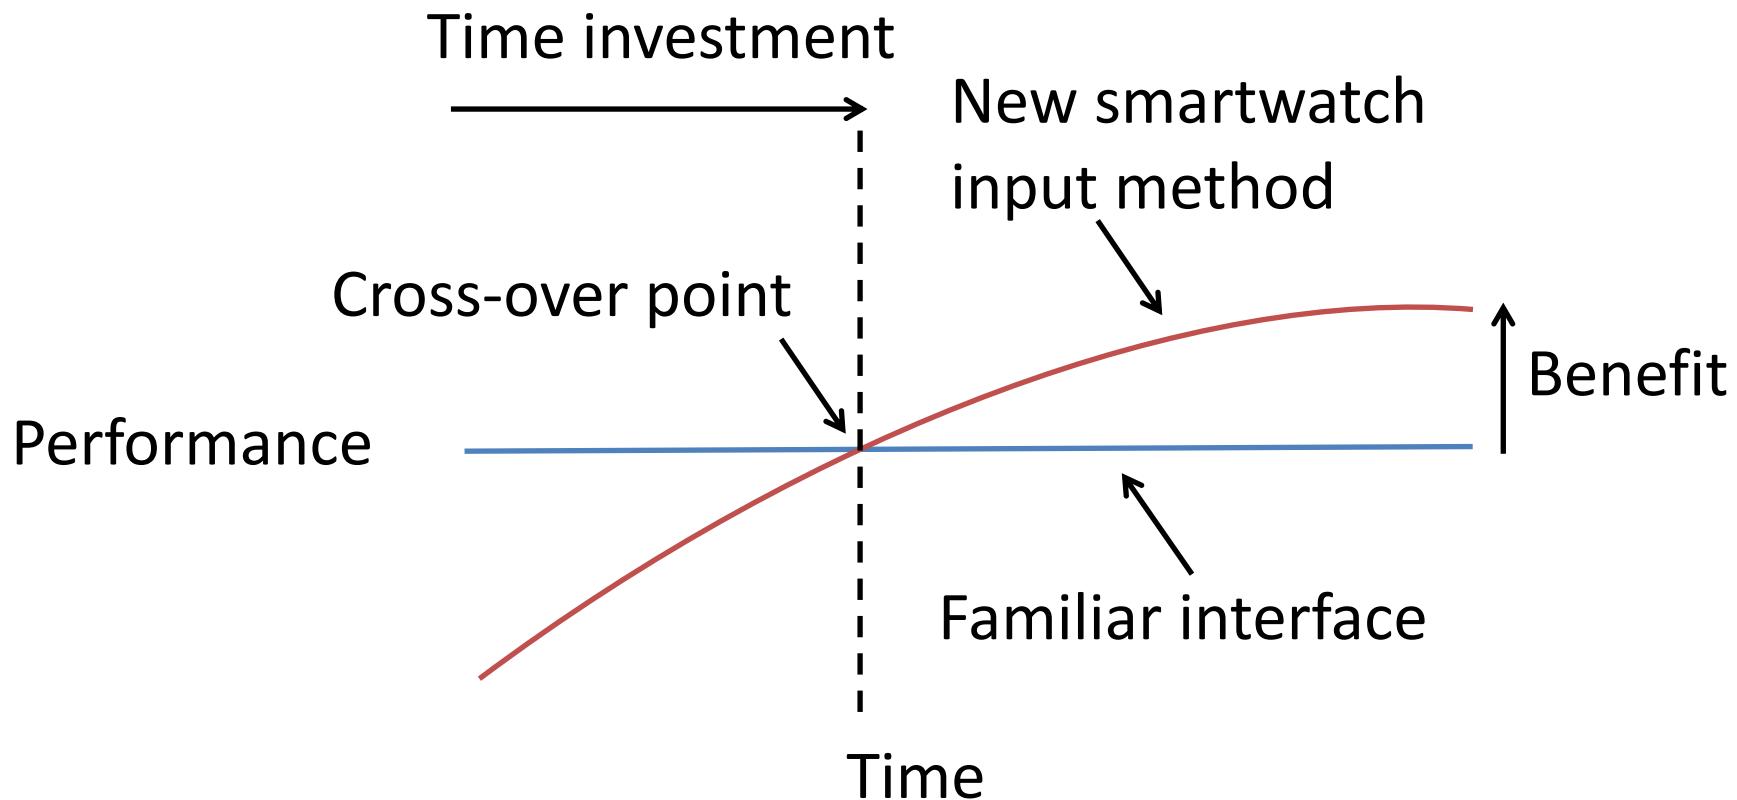

- Small screen size is obviously a constraint
- Many naïve solutions:
 - Progressive zooming techniques
 - Reduce keyset (á la the old telephone keypad techniques)
 - Various multi-stroke strategies
- All slow
- All demand user learning (no immediate efficacy)

The cross-over point

The cross-over point

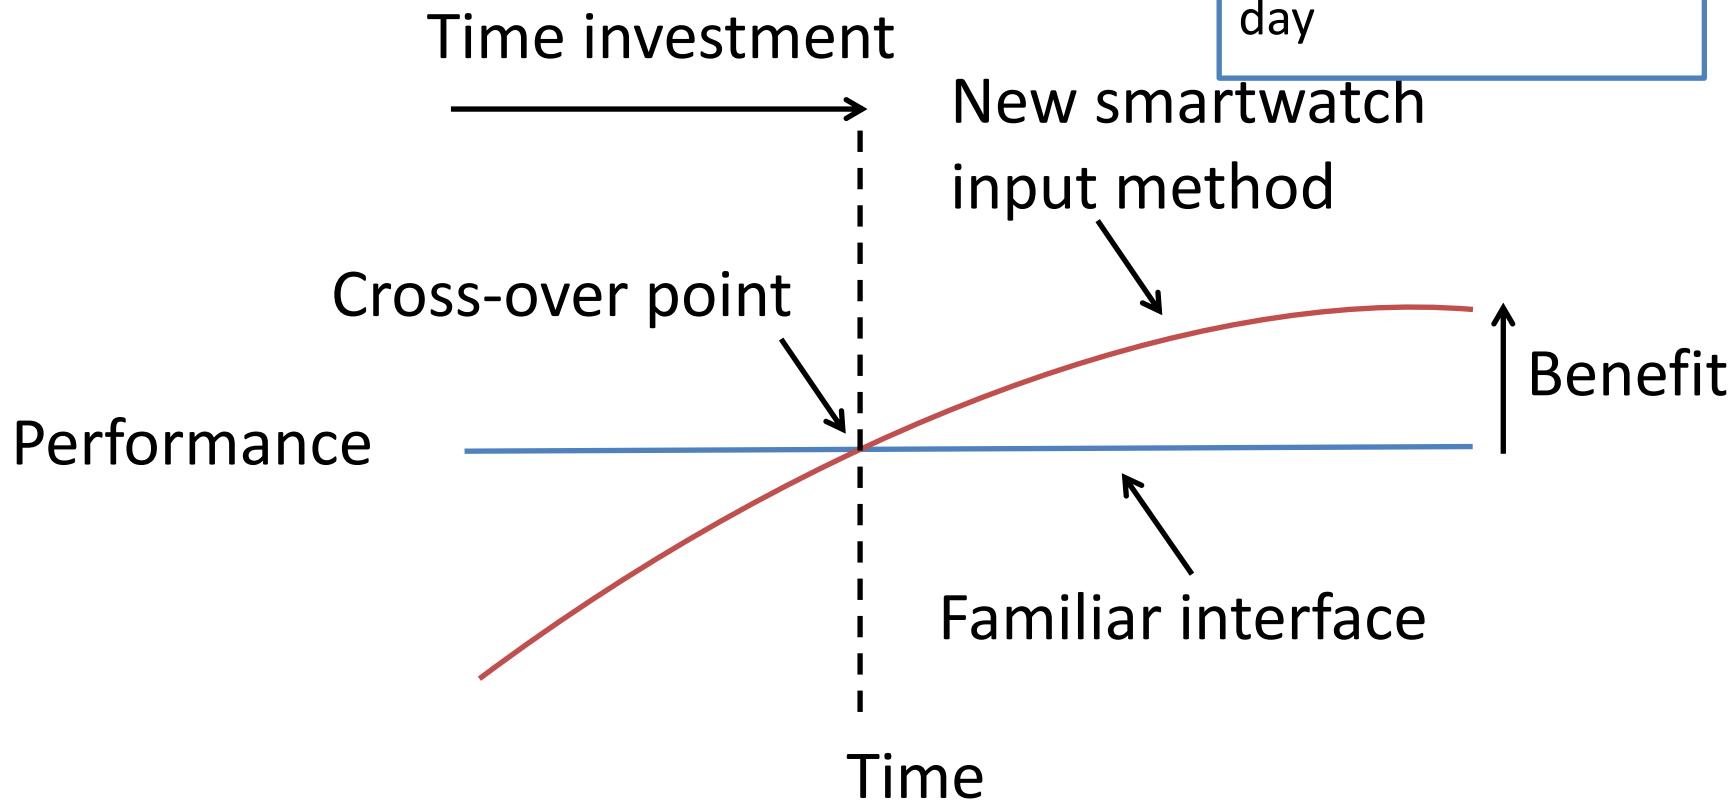

= 40 hours of **dedicated** practice

Softening the word confusion networks: adding epsilon transitions

Softening the word confusion networks: adding wild-card self-loops

Search for the highest joint path in both recognition modalities

Speech-only flexible repair

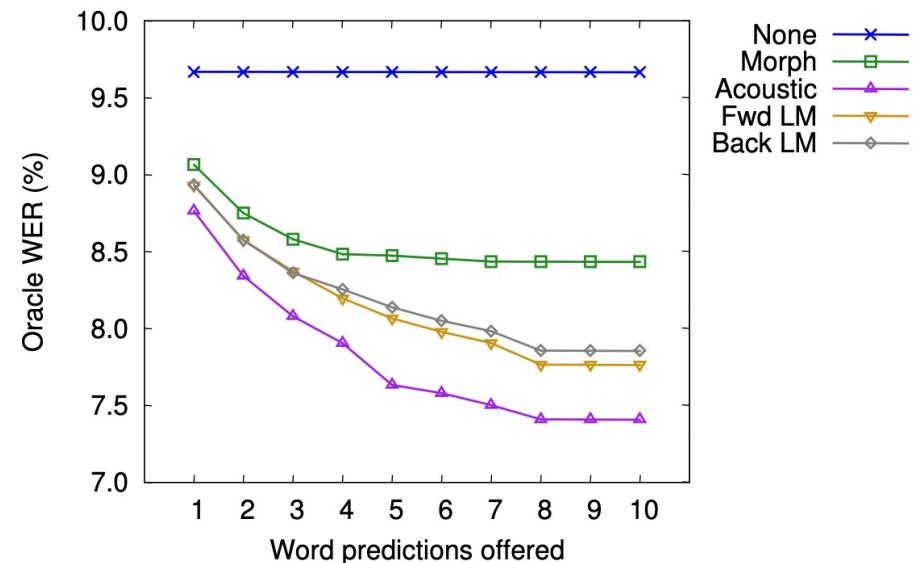

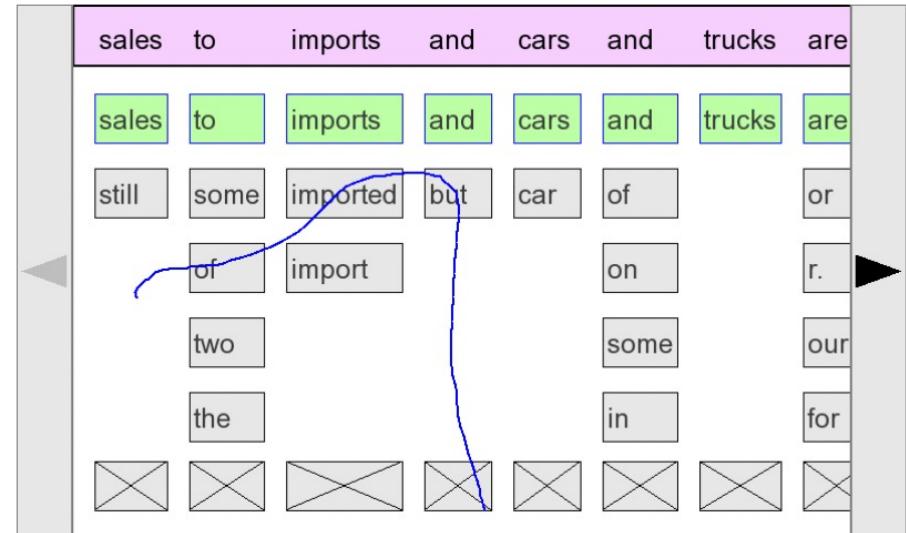

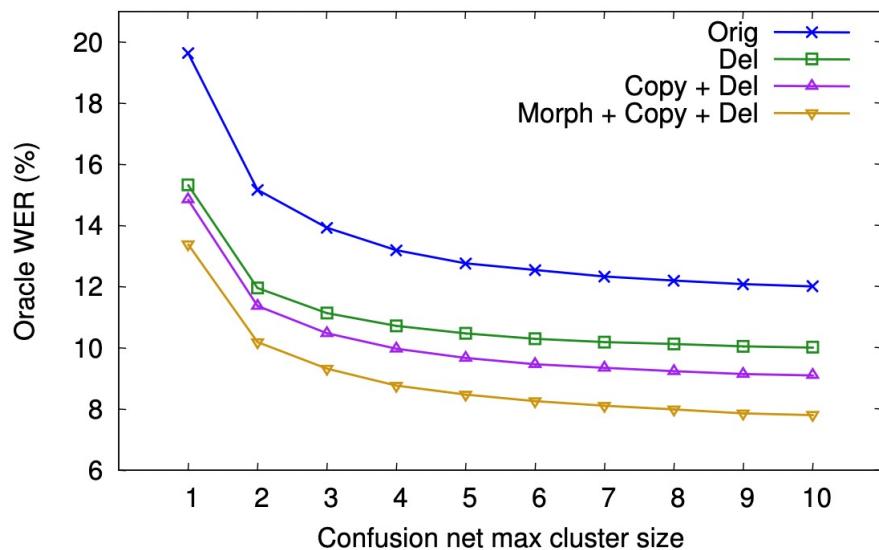

Probabilistic error correction

Probabilistic error correction

- For any probabilistic text entry method...
 - Capable of assigning posterior probability distributions to words
- ...there exists a **hypothesis space**
- The best result is the maximum probability path in this hypothesis space
 - However, it need not be the one the user intended
- By exposing part of the hypothesis space to users, high efficiencies can be gained when users correct words

Example: Parakeet

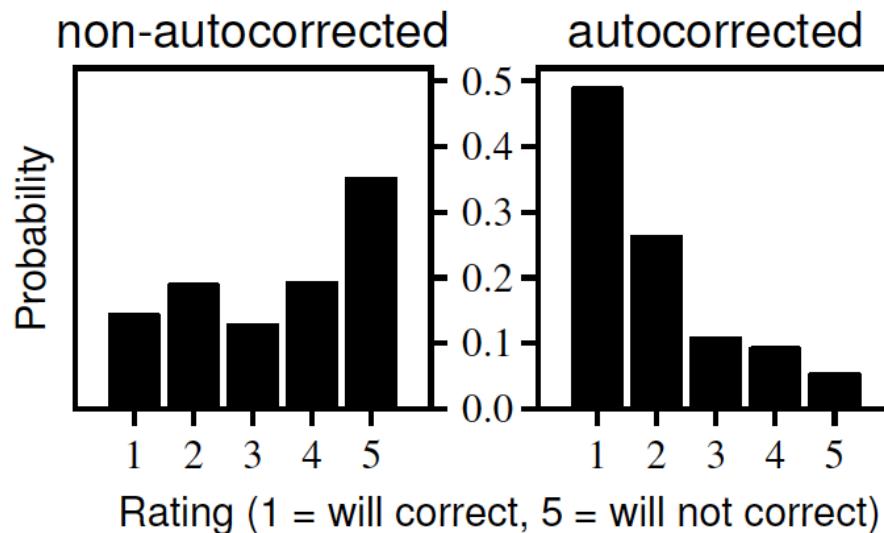

Vertanen, K. and Kristensson, P.O. 2009. Parakeet: a demonstration of speech recognition on a mobile touch-screen device. In *Proceedings of the 14th ACM International Conference on Intelligent User Interfaces (IUI 2009)*. (Demonstration). ACM Press: 483-484.

Fluid regulation of uncertainty

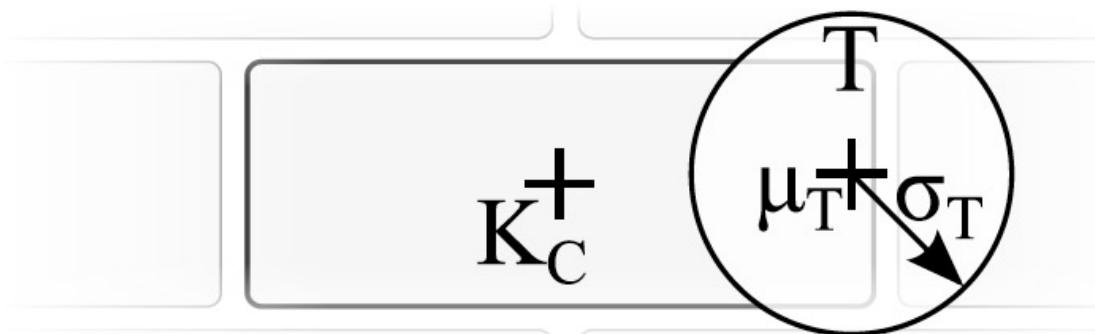

The auto-correct trap

- Auto-correct is great when it works
- However, when auto-correct fails error correction activities exhibit a high penalty
- The solution is to provide users with more **agency** and allow them to regulate their **certainty**

Weir, D., Pohl, H., Rogers, S., Vertanen, K. and Kristensson, P.O. 2014. Uncertain text entry on mobile devices. In *Proceedings of the 32nd ACM Conference on Human Factors in Computing Systems (CHI 2014)*. ACM Press: 2307-2316.

Pressure-sensitive auto-correct

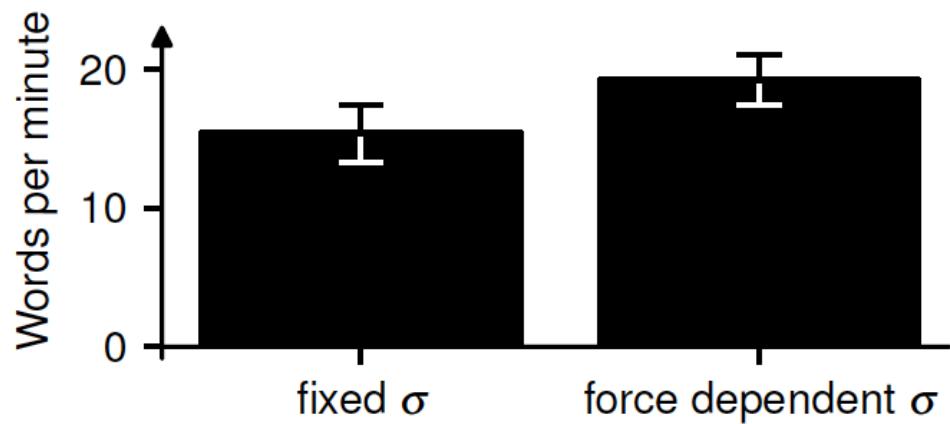

- Likelihood of a Gaussian with standard deviation regulated by pressure
- Standard deviation computed as C/ω_T , where C is a constant and ω_T is the pressure for touch T
- Tuned C so that the pressure of a typical touch had a standard deviation of half a key width

Weir, D., Pohl, H., Rogers, S., Vertanen, K. and Kristensson, P.O. 2014. Uncertain text entry on mobile devices. In *Proceedings of the 32nd ACM Conference on Human Factors in Computing Systems (CHI 2014)*. ACM Press: 2307-2316.

Results

- Enabling users to regulate their certainty by force resulted in a 10% percentage drop in active corrections (fixing a word by backspacing or retyping)
- This improved entry rate by 20%

Human performance estimate of dwell-free eye-typing

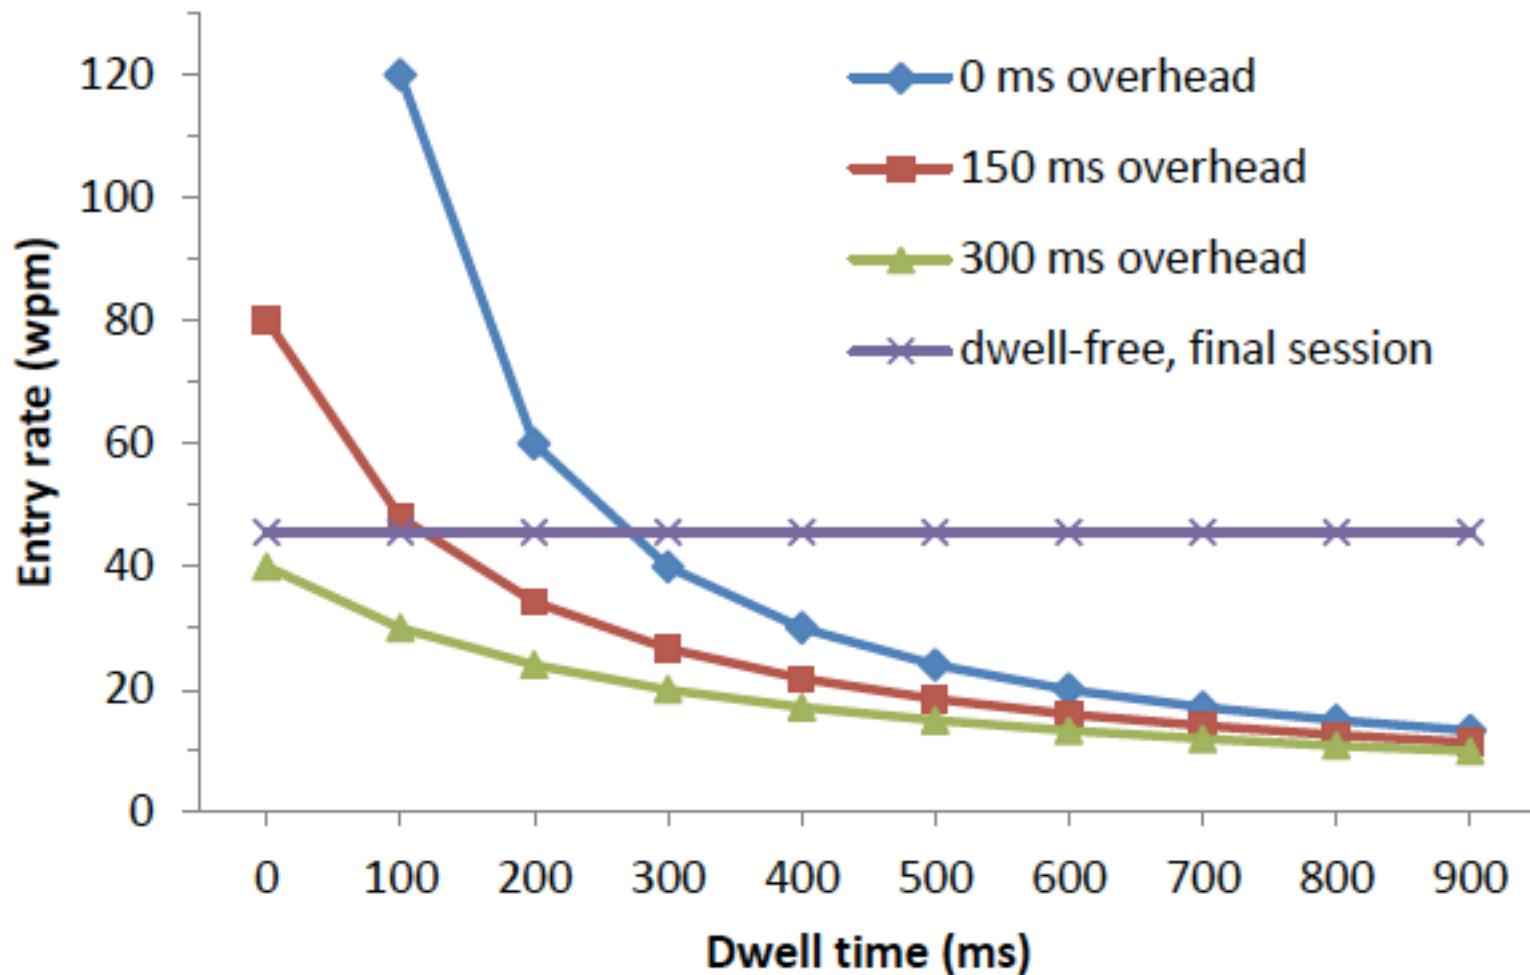

- Recorded 400 minutes of eye-trace data
- Participants entered a total of 2026 phrases
- Participants were prompted phrases and asked to copy them as quickly and as accurately as possible
- Our system knew what the user was supposed to write and verified that the user is gazing at the letter sequence corresponding to the stimulus

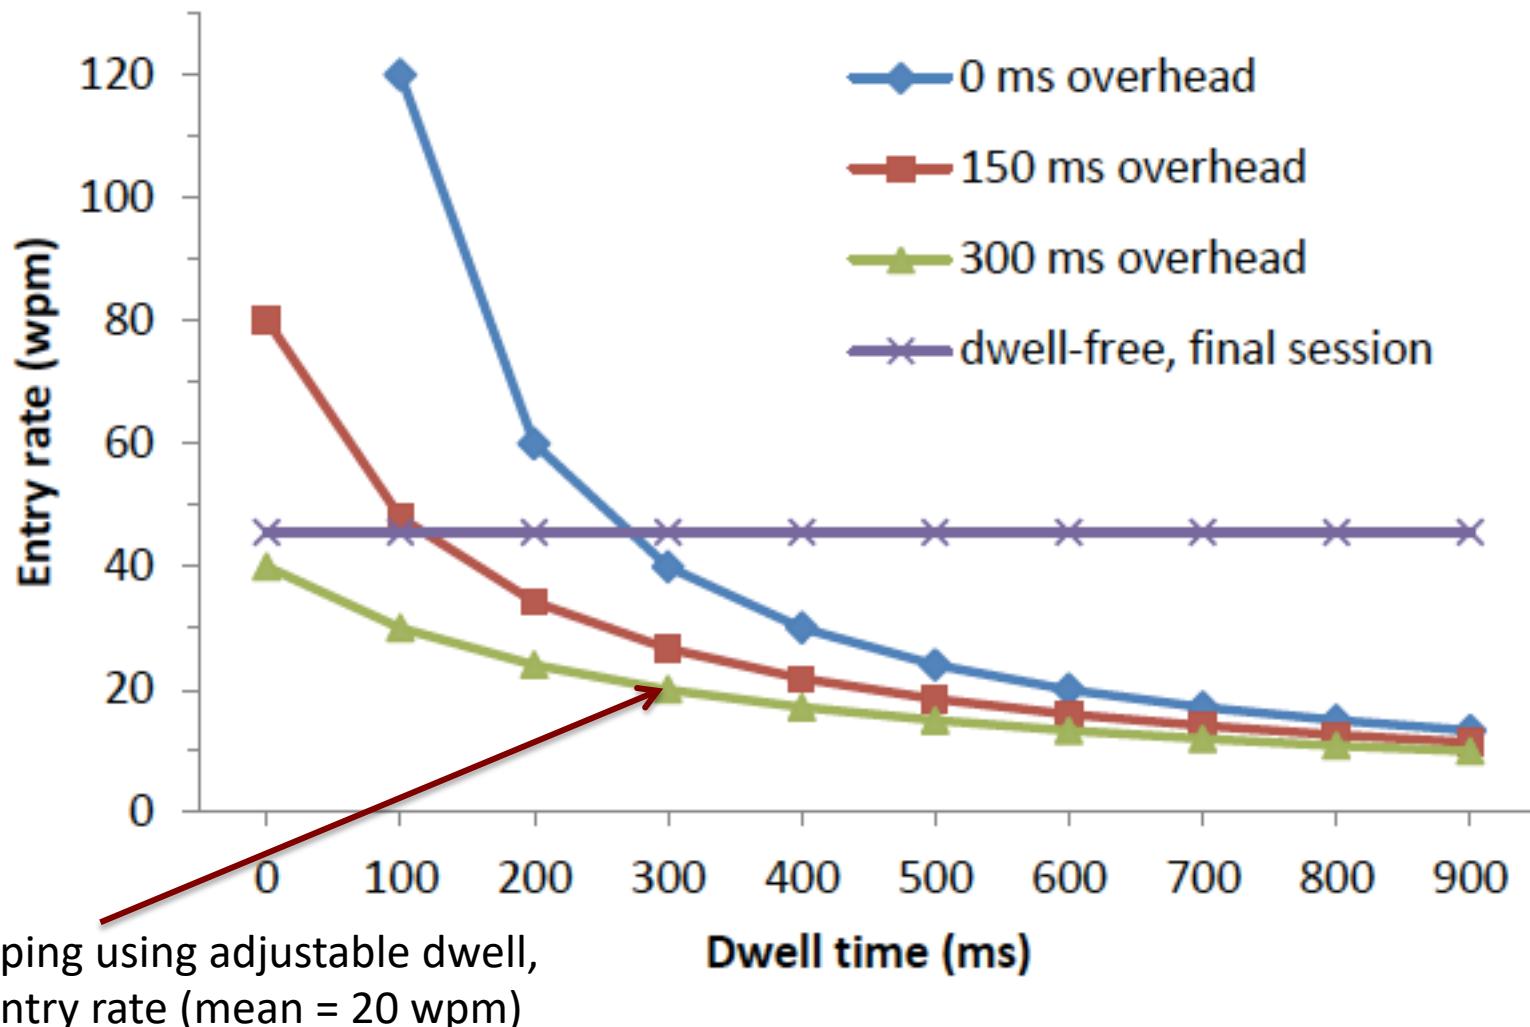

Entry rate

entry rate in the first session (mean = 6.9 wpm)

A step-change in gaze communication

- **Existing gaze communication solutions**
 - Limited to circa 20 wpm
- **Dwell-free eye-typing**
 - Empirically measured human performance potential: 46 wpm average
- Released as a product: Tobii-Dynavox I-Series+

Kristensson, P.O., Mjelde, M. and Vertanen, K. 2023. Understanding adoption barriers to dwell-free eye-typing: design implications from a qualitative deployment study and computational simulations. In *Proceedings of the 28th ACM International Conference on Intelligent User Interfaces (IUI 2023)*. ACM Press: 607-620.

Session 1: summary

- A text entry method likely to be adopted by users is probably similar to existing solutions and at least as fast
- It is still possible to make progress by using a few solution principles:
 - From closed to open-loop
 - Continuous novice-to-expert transition
 - Path dependency
 - Flexibility
 - Probabilistic error correction
 - Fluid regulation of uncertainty
 - Efficiency
- In general, these can be viewed as **solution principles for uncertain interaction**
